Pressure probe and SiCSA techniques The expanding maize root tip Use of the cell pressure probe (Htiskén et al. , 1978) and single-cell sampling and analysis (SiCSA; Tomos Individual cells expand to many times their original length as they progress from the meristem to the and solute relations at the resolution of the individual mature zone of root tips. The expansion first accelerates cell. In the case of water relations, the pressure probe accelerates and then decelerates, stopping at the proximal provides the only technique that measures cell turgor end of the expansion zone (Pritchard, 1994). This is turgor pressure, and hence turgor adjustment processes, accomplished at constant cell turgor (P) and with a loss directly. In some cases, such as the motor cells of pulsed osmotic (Pritchard et al. , 1993) pressure in the order of 15% (wheat: vinit or in the stomatal complex, turgor varies between Tomos et al. , 1989; maize: Pritchard et al. , 1993; adjacent cells - making analysis at single cell resolution Pritchard and Tomos, 1993). The constant turgor condition essential for understanding mechanisms (Irving et al. , 1994) that changes in cell-wall mechanical properties, al. , 1994). Correlating turgor pressure measurements rather than driving force, are responsible for the immediate with cell expansion rate permits unique measurement direct control of expansion-rate in roots (Pritchard et al. | 1.
